Tableau Calculations

Calculations

■ Why use calculations

- ◆ To create new data from data that already exists in your data source
- ◆ Perform computations on your data to perform complex analyzes and add fields to your data source on your own and on the fly.

Calculations

■ Why use calculations

- ◆ To create new data from data that already exists in your data source
- ◆ Perform computations on your data to perform complex analyzes and add fields to your data source on your own and on the fly.

■ When to use calculations (some examples)

- ◆ To segment data

Calculations

Types of calculations

- **Basic expressions**

https://onlinehelp.tableau.com/current/pro/desktop/en-us/calculations_calculatedfields_understand_types.htm

Types of calculations

- **Basic expressions**

- Calculation at **source level of detail** (a row-level calculation)

https://onlinehelp.tableau.com/current/pro/desktop/en-us/calculations_calculatedfields_understand_types.htm

Types of calculations

■ Basic expressions

- Calculation at **source level of detail** (a row-level calculation)
- Calculation at the **visualization level of detail** (an aggregate calculation)

https://onlinehelp.tableau.com/current/pro/desktop/en-us/calculations_calculatedfields_understand_types.htm

Types of calculations

■ Basic expressions

- Calculation at **source level of detail** (a row-level calculation)
- Calculation at the **visualization level of detail** (an aggregate calculation)

■ Level of Detail (LOD) expressions

- FIXED Level of detail - set of dimensions
- INCLUDE or EXCLUDE - set of dimensions

https://onlinehelp.tableau.com/current/pro/desktop/en-us/calculations_calculatedfields_understand_types.htm

Types of calculations

■ Basic expressions

- Calculation at **source level of detail** (a row-level calculation)
- Calculation at the **visualization level of detail** (an aggregate calculation)

■ Level of Detail (LOD) expressions

- FIXED Level of detail - set of dimensions
- INCLUDE or EXCLUDE - set of dimensions

■ Table calculations

- Are performed **after the query returns** and therefore can only operate over values that are in the query result set.

Harry Potter	

To create a column that displays how many books are in each series

```
COUNT([Series])
```

Number of Books in Series - at Series level of detail

Basic expressions - aggregate calculation

The screenshot shows the Tableau interface. The 'Columns' shelf contains the 'Series' field. The 'Rows' shelf is empty. The 'Marks' shelf is set to 'Automatic'. The 'Marks' card is highlighted in green and contains the text 'AGG(Number o..'. The 'Columns' shelf contains a table with the following data:

Series	Count
Harry Potter	7
The Chronicles of Narnia	7

To create a column that displays how many books are in each series

```
COUNT([Series])
```

Number of Books in Series -
at Series level of detail

Basic expressions - aggregate calculation

The screenshot shows the Tableau interface with a table view. The 'Columns' shelf contains 'Book Id' and 'Series'. The 'Rows' shelf is empty. The 'Marks' card is set to 'AGG(Number o..)'. The table data is as follows:

Book Id	Series	
1	The Chronicles of Narnia	1
2	The Chronicles of Narnia	1
3	The Chronicles of Narnia	1
4	The Chronicles of Narnia	1
5	The Chronicles of Narnia	1
6	The Chronicles of Narnia	1
7	The Chronicles of Narnia	1
8	Harry Potter	1
9	Harry Potter	1
10	Harry Potter	1
11	Harry Potter	1
12	Harry Potter	1
13	Harry Potter	1
14	Harry Potter	1

To create a column that displays how many books are in each series

```
COUNT([Series])
```

Number of Books in Series -
at Series level of detail

Aggregate calculations are performed at the visualization level of detail

Level of Detail (LOD) expressions

Level of Detail (LOD) expressions

- Just like basic expressions, LOD expressions **allow you to compute values at the data source level and the visualization level.**

Level of Detail (LOD) expressions

- Just like basic expressions, LOD expressions **allow you to compute values at the data source level and the visualization level.**
- However, LOD expressions give you even **more control on the level of granularity you want to compute.** They can be performed:
 - ◆ at a more granular level (**INCLUDE**),

Level of Detail (LOD) expressions

- Just like basic expressions, LOD expressions **allow you to compute values at the data source level and the visualization level.**
- However, LOD expressions give you even **more control on the level of granularity you want to compute.** They can be performed:
 - ◆ at a more granular level (**INCLUDE**),
 - ◆ a less granular level (**EXCLUDE**),

Level of Detail (LOD) expressions

- Just like basic expressions, LOD expressions **allow you to compute values at the data source level and the visualization level.**
- However, LOD expressions give you even **more control on the level of granularity you want to compute.** They can be performed:
 - ◆ at a more granular level (**INCLUDE**),
 - ◆ a less granular level (**EXCLUDE**),
 - ◆ or an entirely independent level (**FIXED**)

Level of Detail (LOD) expressions

Book ID	Book Name	Series	Year Released	Author	Series Launched
1	The Lion, the Witch and the Wardrobe	The Chronicles of Narnia	1950	C. S. Lewis	1950
2	Prince Caspian: The Return to Narnia	The Chronicles of Narnia	1951	C. S. Lewis	1950
3	The Voyage of the Dawn Treader	The Chronicles of Narnia	1952	C. S. Lewis	1950
4	The Silver Chair	The Chronicles of Narnia	1953	C. S. Lewis	1950
5	The Horse and His Boy	The Chronicles of Narnia	1954	C. S. Lewis	1950
6	The Magician's Nephew	The Chronicles of Narnia	1955	C. S. Lewis	1950
7	The Last Battle	The Chronicles of Narnia	1956	C. S. Lewis	1950

Series	Year Released	Year Released
The Chronicles of Narnia	1950	1950
	1951	1950
	1952	1950
	1953	1950
	1954	1950
	1955	1950
	1956	1950
Harry Potter	1997	1997
	1998	1997
	1999	1997
	2000	1997
	2003	1997
	2005	1997
	2007	1997

wanted to compute **when a book series was launched**

```
{ FIXED [Series]:(MIN([Year Released])) }
```

Series Launched

Table calculations

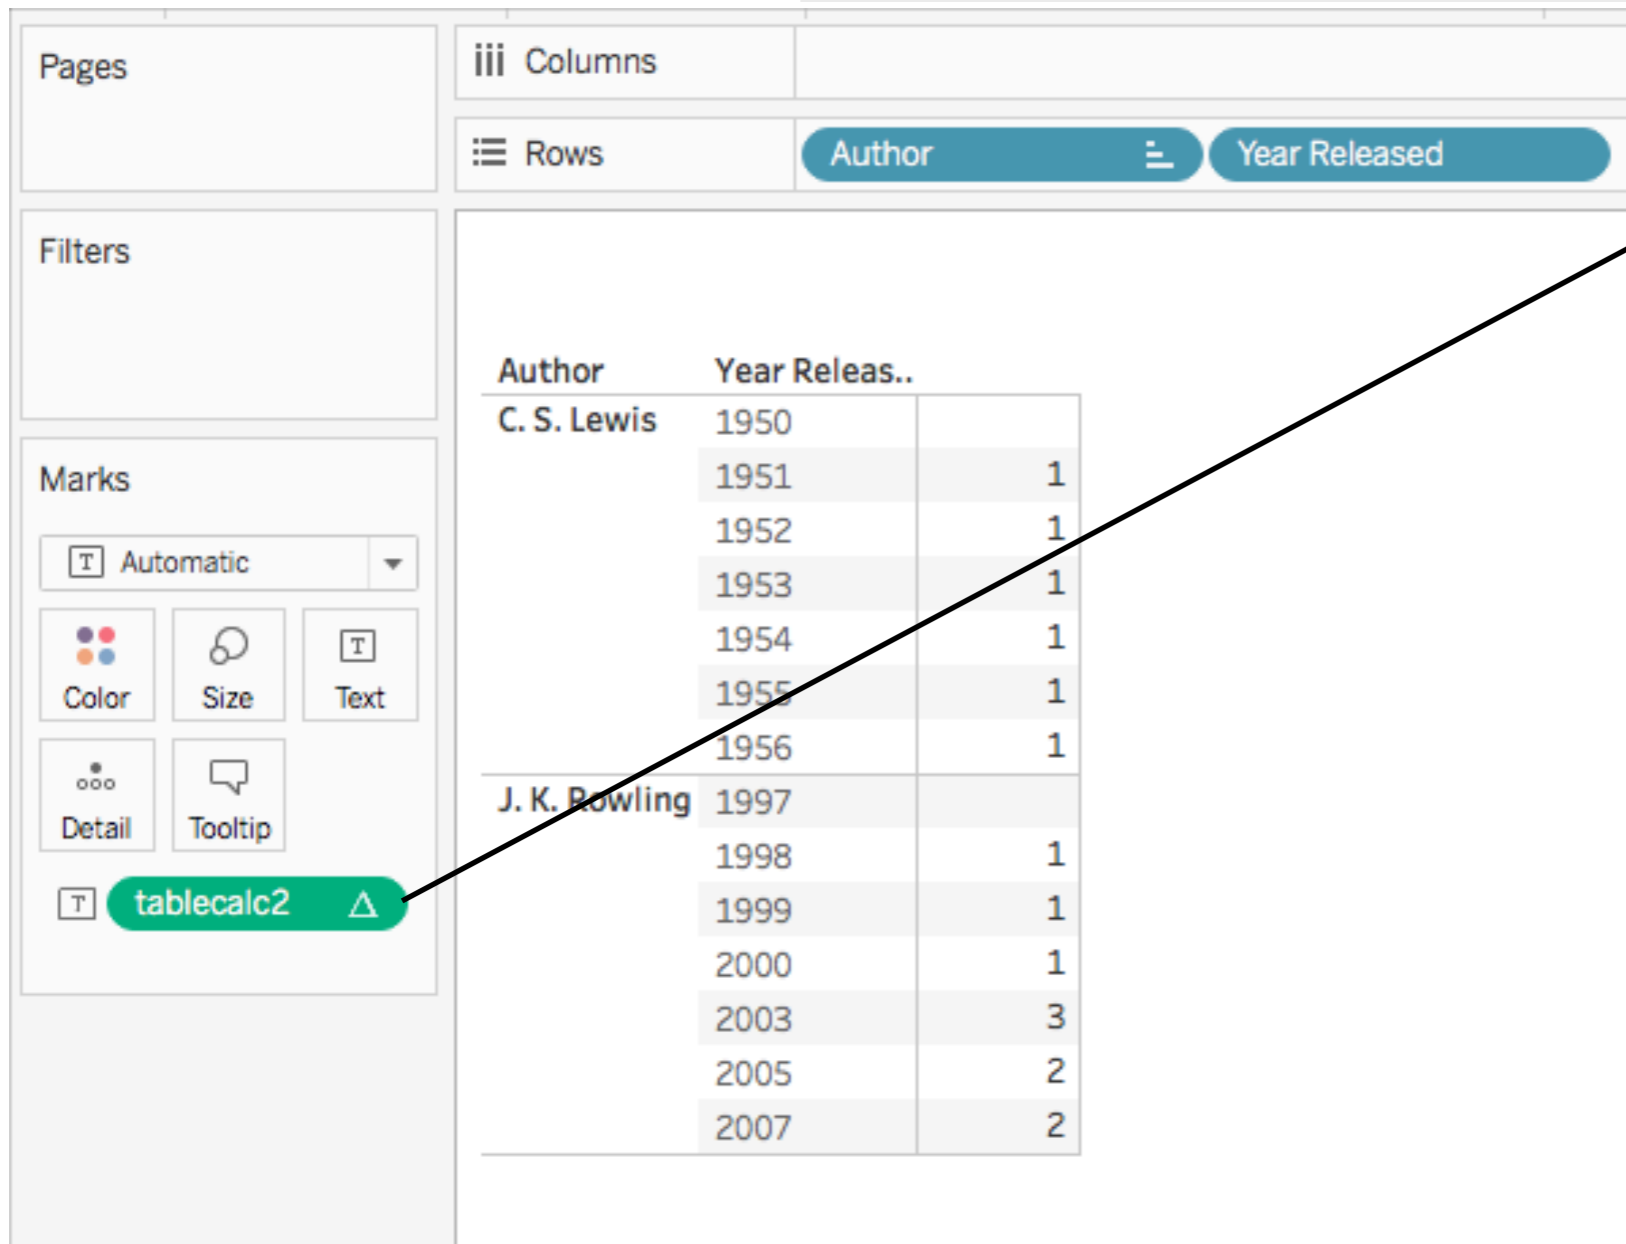

- Table calculations allow you to **transform** values at the **level of detail of the visualization only**.
- The computation **works on the data table that is used for the data visualization !**
- To compute the number of years since the author released their last book, you might use the following table calculation:

```
ATTR([Year Released]) - LOOKUP(ATTR([Year Released]), -1)
```

Number of Books in Series -
at Series level of detail

Table calculations

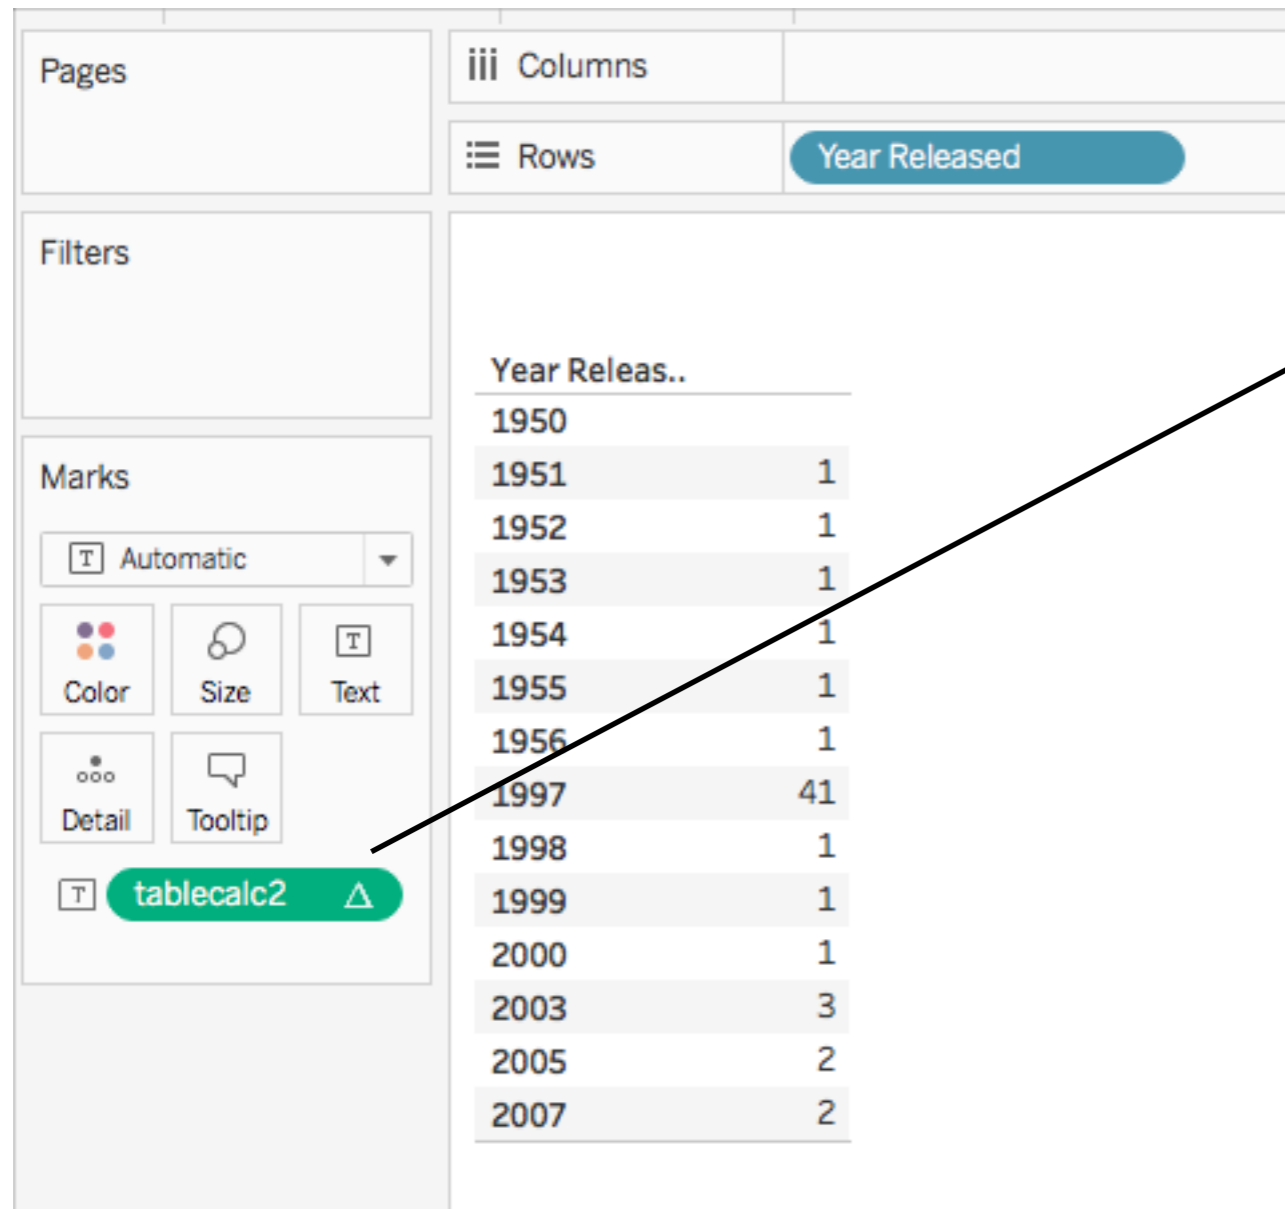

```
ATTR([Year Released]) - LOOKUP(ATTR([Year Released]), -1)
```

Number of Books in Series -
at Series level of detail

Table calculations

```
ATTR([Year Released]) - LOOKUP(ATTR([Year Released]), -1)
```

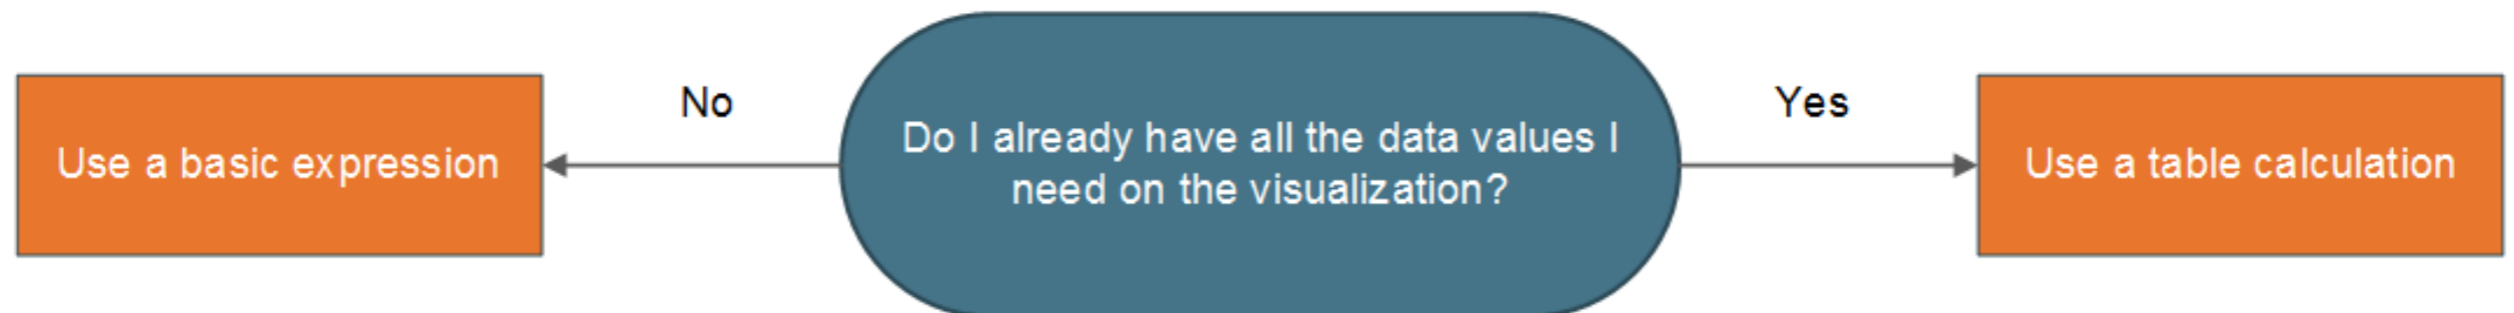

Number of Books in Series -
at Series level of detail

Choosing the Right Calculation Type

■ Basic expression or table calculation?

- ◆ **Question 1:** Do you already have all the data values you need on the visualization?
- ◆ If the answer is yes: You can use a **table calculation**.
- ◆ If the answer is no: Use a **basic calculation**.

https://onlinehelp.tableau.com/current/pro/desktop/en-us/calculations_calculatedfields_understand_which.htm

Choosing the Right Calculation Type

■ Basic expression or Level of Detail (LOD) expression?

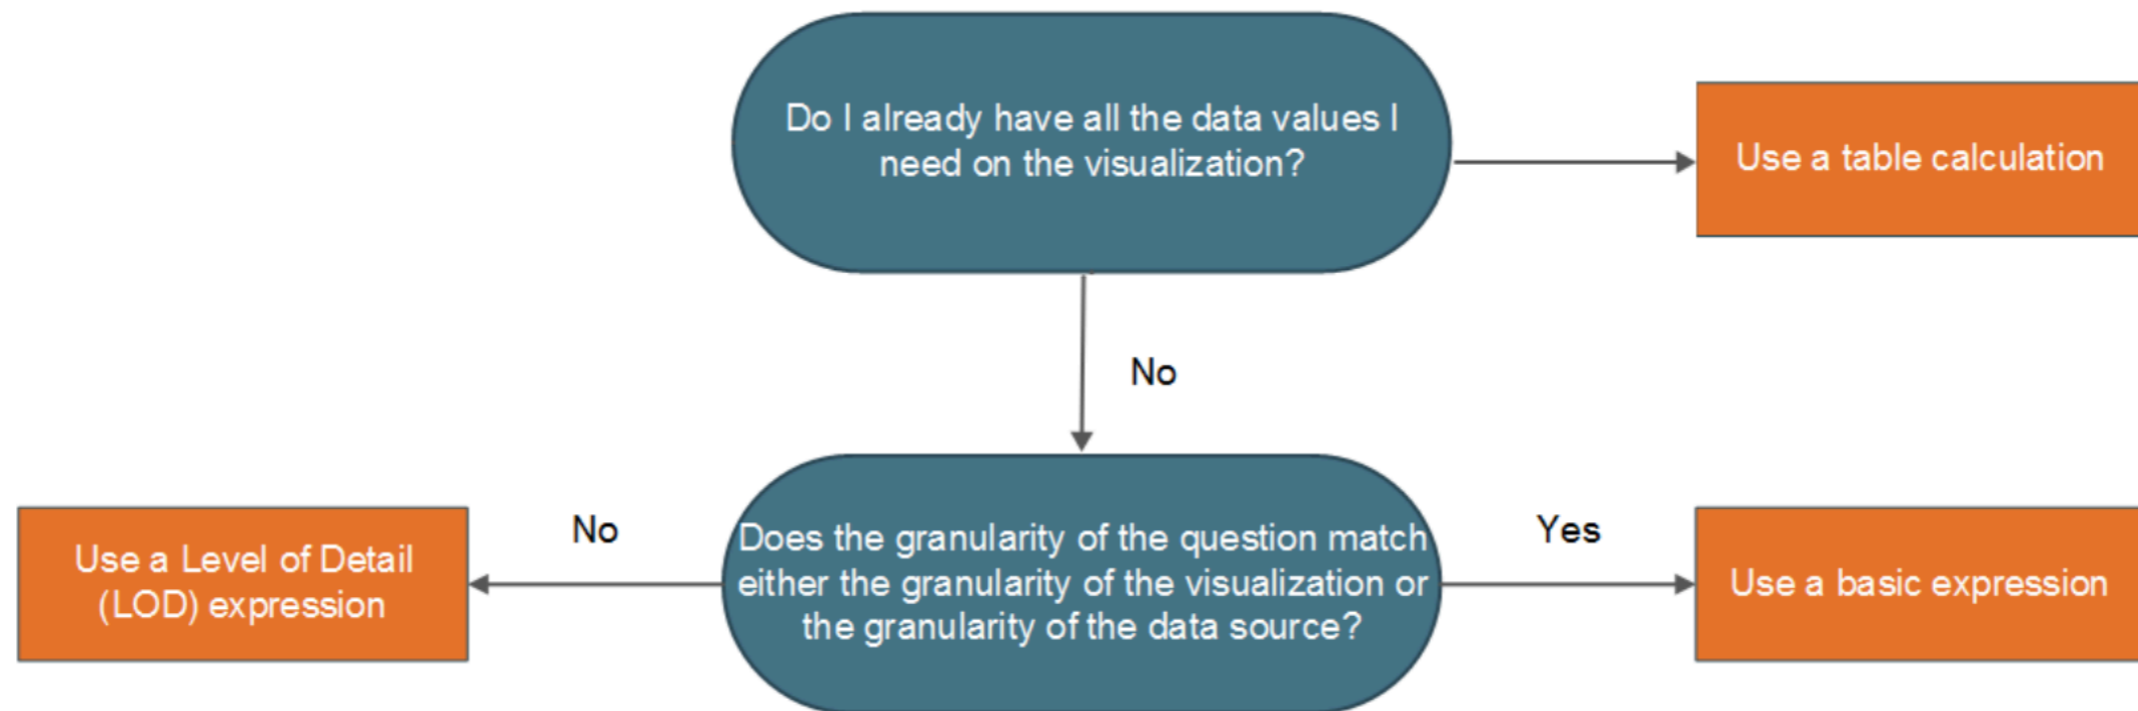

If you don't have all the data you need on the visualization, you need your calculation to be passed through to the data source. This means you must use a basic calculation or an LOD Expression.

If you answered **no** to **question 1** ask yourself this:

Question 2: Does the granularity of your question match either the granularity of the visualization or the granularity of the data source?

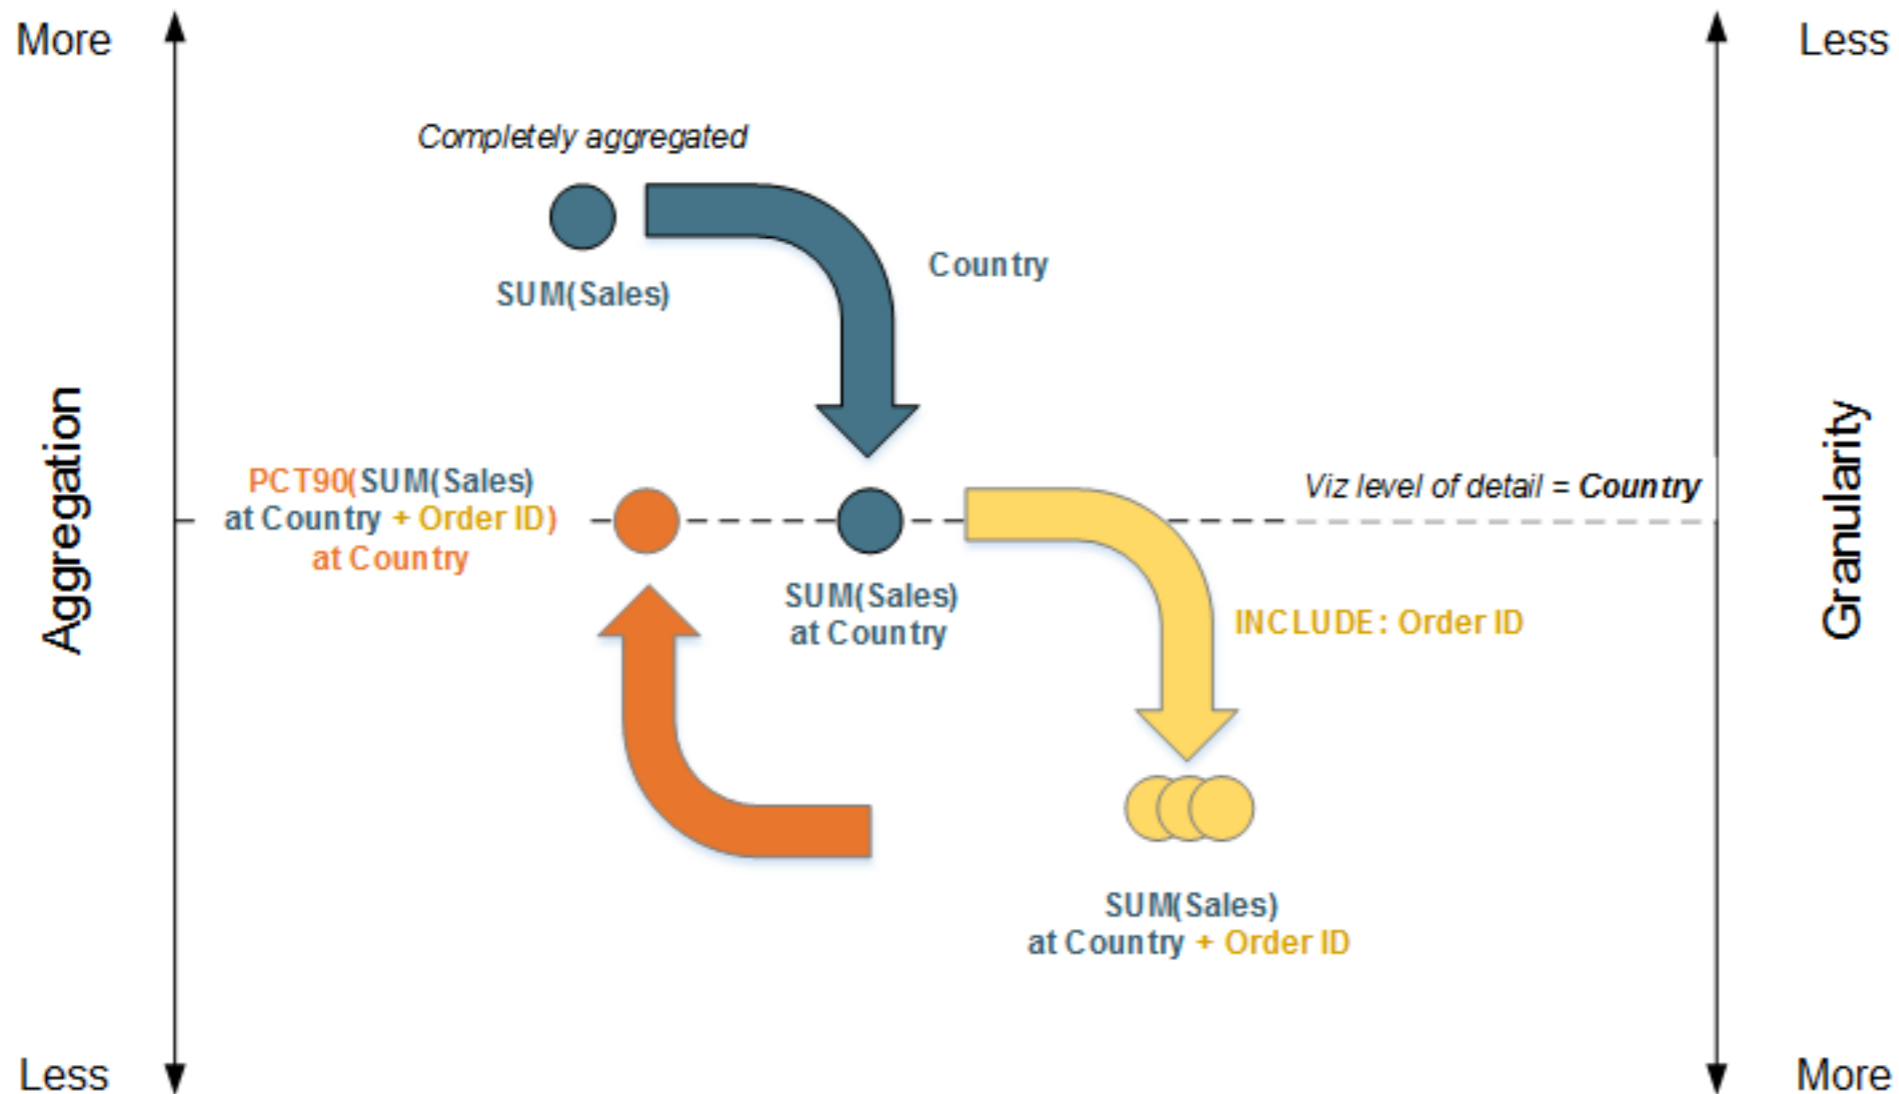

If the answer is **yes**: Use a basic expression.

If the answer is **no**: Use a Level of Detail (LOD) expression.

Choosing the Right Calculation Type

- Basic expression or Level of Detail (LOD) expression?

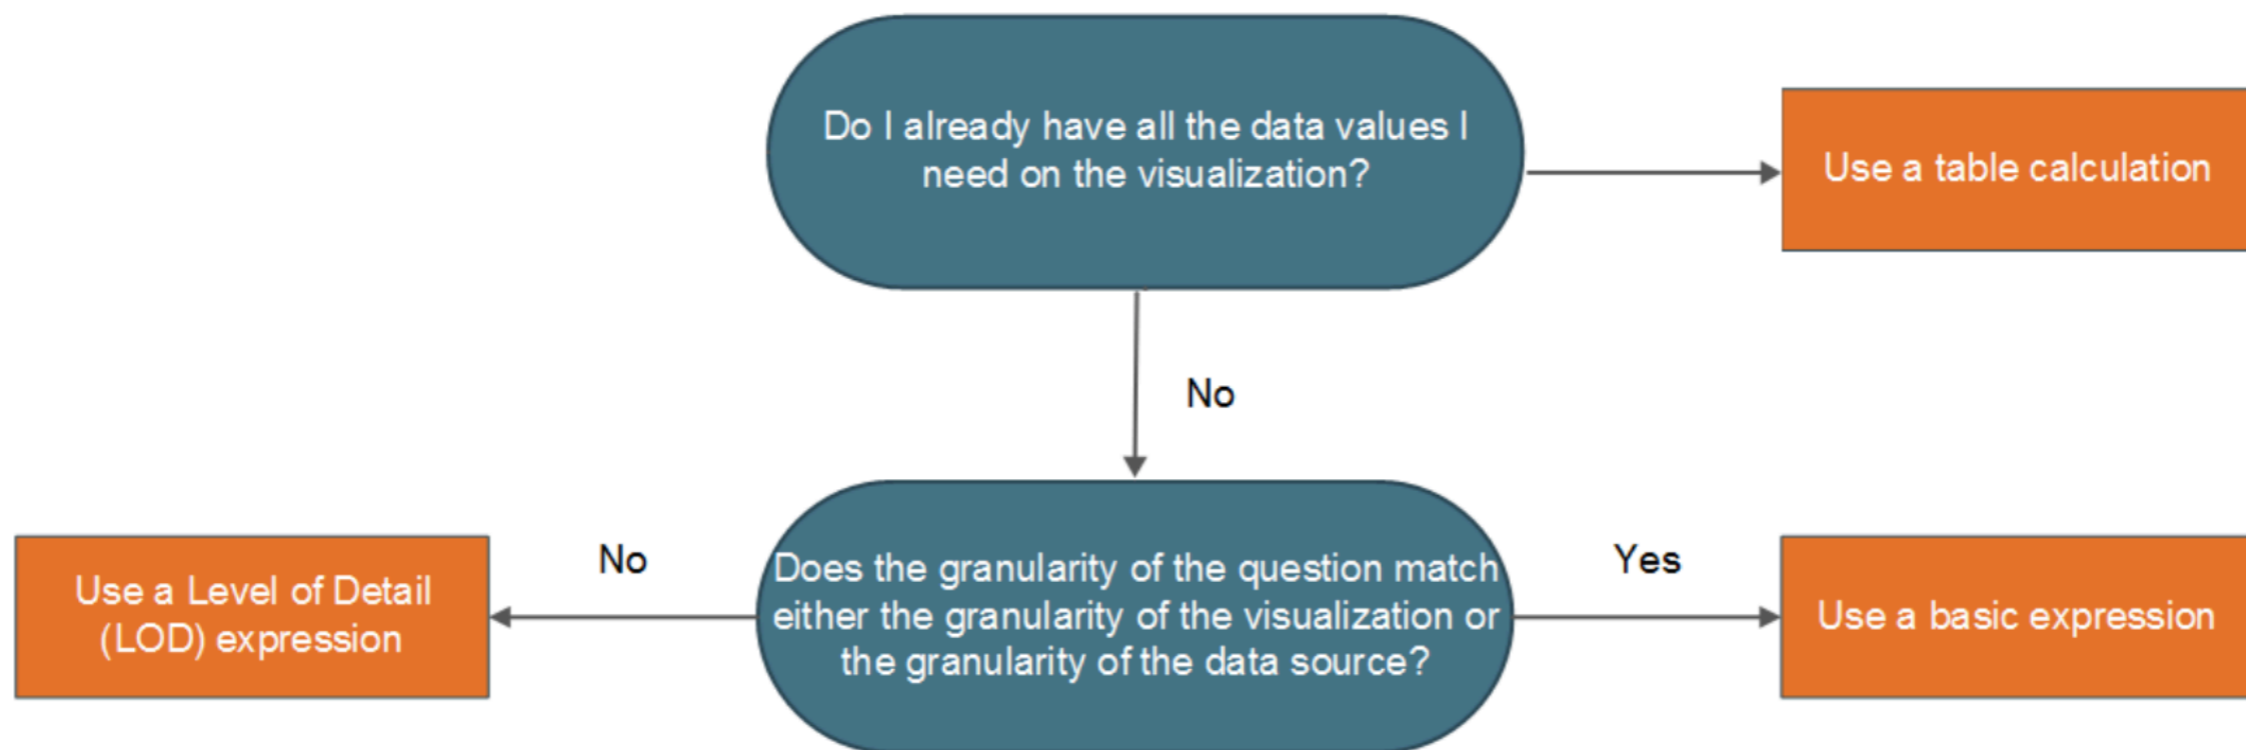

Choosing the Right Calculation Type

■ Table calculation or Level of Detail (LOD) expression?

Do you already have all the data values you need on the visualization?

- If the answer is **Yes**, then use a table calculation.
- If the answer is **No**, then ask yourself: *Does the granularity of the question match either the granularity of the visualization or the granularity of the data source?* If the answer is **No**, then use an LOD calculation.

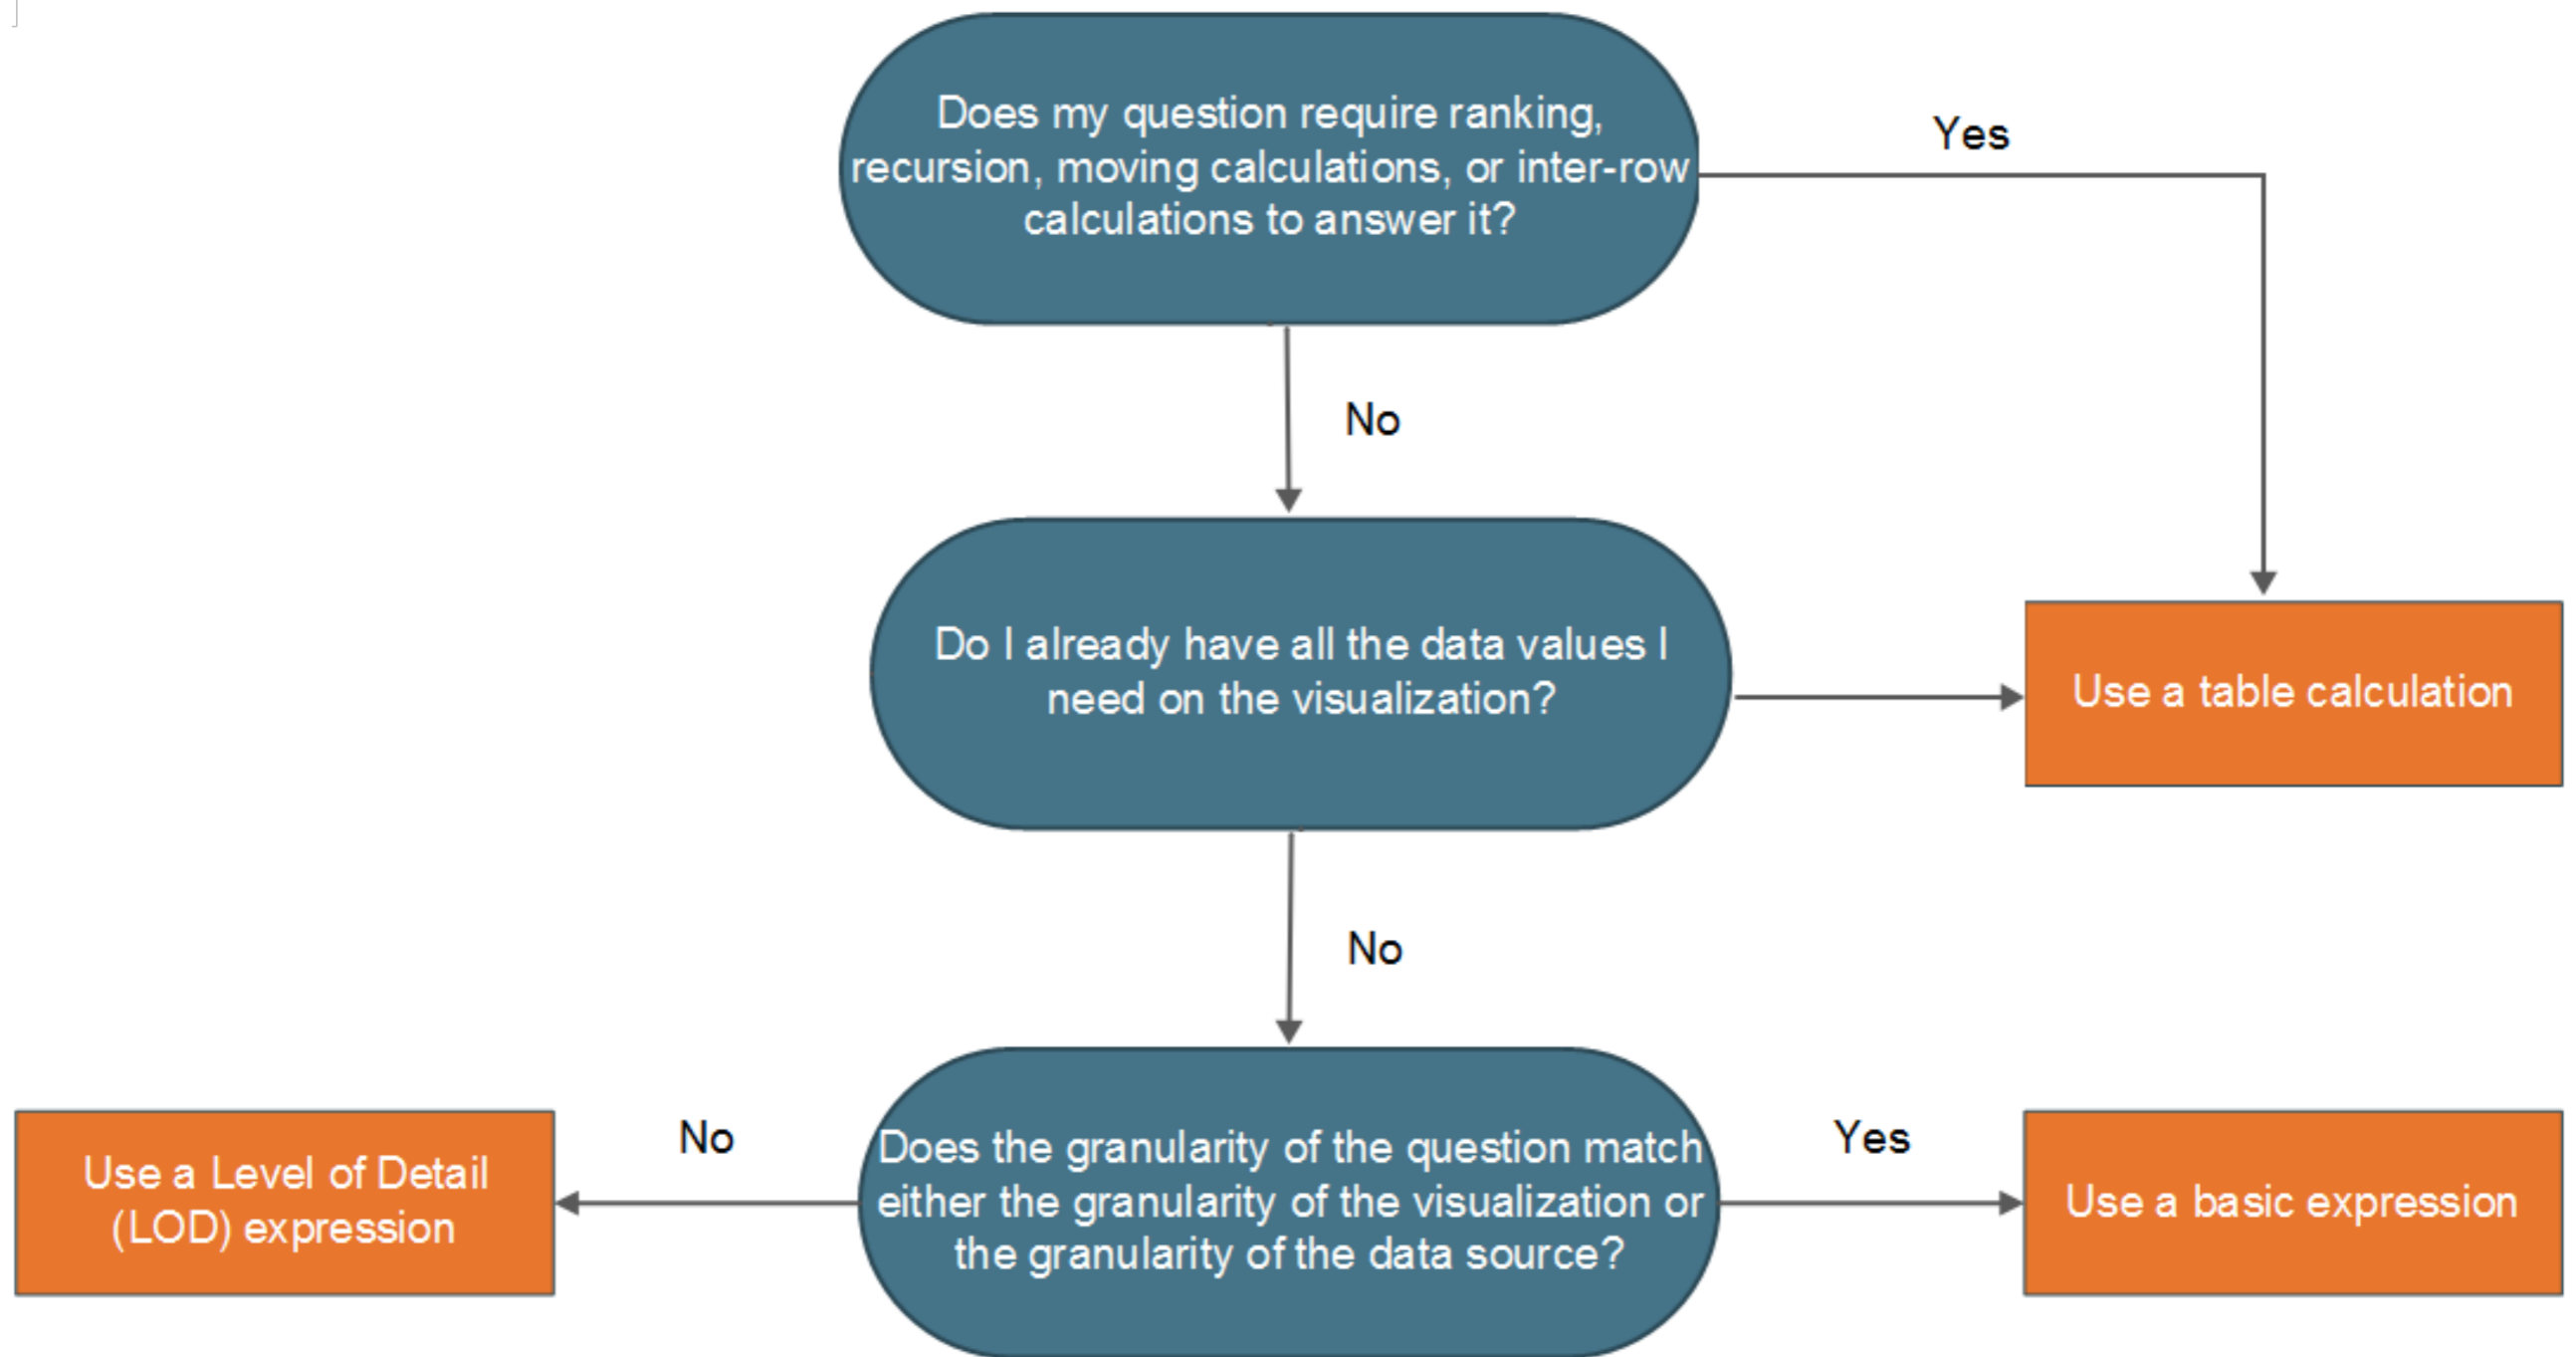

Choosing the Right Calculation Type

- **Table calculations only**

- ◆ **There are some scenarios where only a table calculation will do, including:**

- Ranking
- Recursion (e.g. cumulative totals)
- Moving calculations (e.g. rolling averages)
- Inter-row calculations (e.g. period vs. period calculations)

Choosing the Right Calculation Type

Functions in tableau

Level of Detail (LOD) expressions

Level of Detail (LOD) expressions

- **Check this tutorial: Create Level of Detail Expressions in Tableau**
 - ◆ https://onlinehelp.tableau.com/current/pro/desktop/en-us/calculations_calculatedfields_lod.htm
 - ◆ Using the sample workbook - **Sample-Superstore**

Level of Detail (LOD) expressions: INCLUDED

- In the same view we want
 - ◆ SUM of sales per Region
 - ◆ AVG of sales per Customer
- Create ***Sales Per Customer.***
- Include both in a view with region

```
{ INCLUDE [Customer Name] : SUM([Sales]) }
```

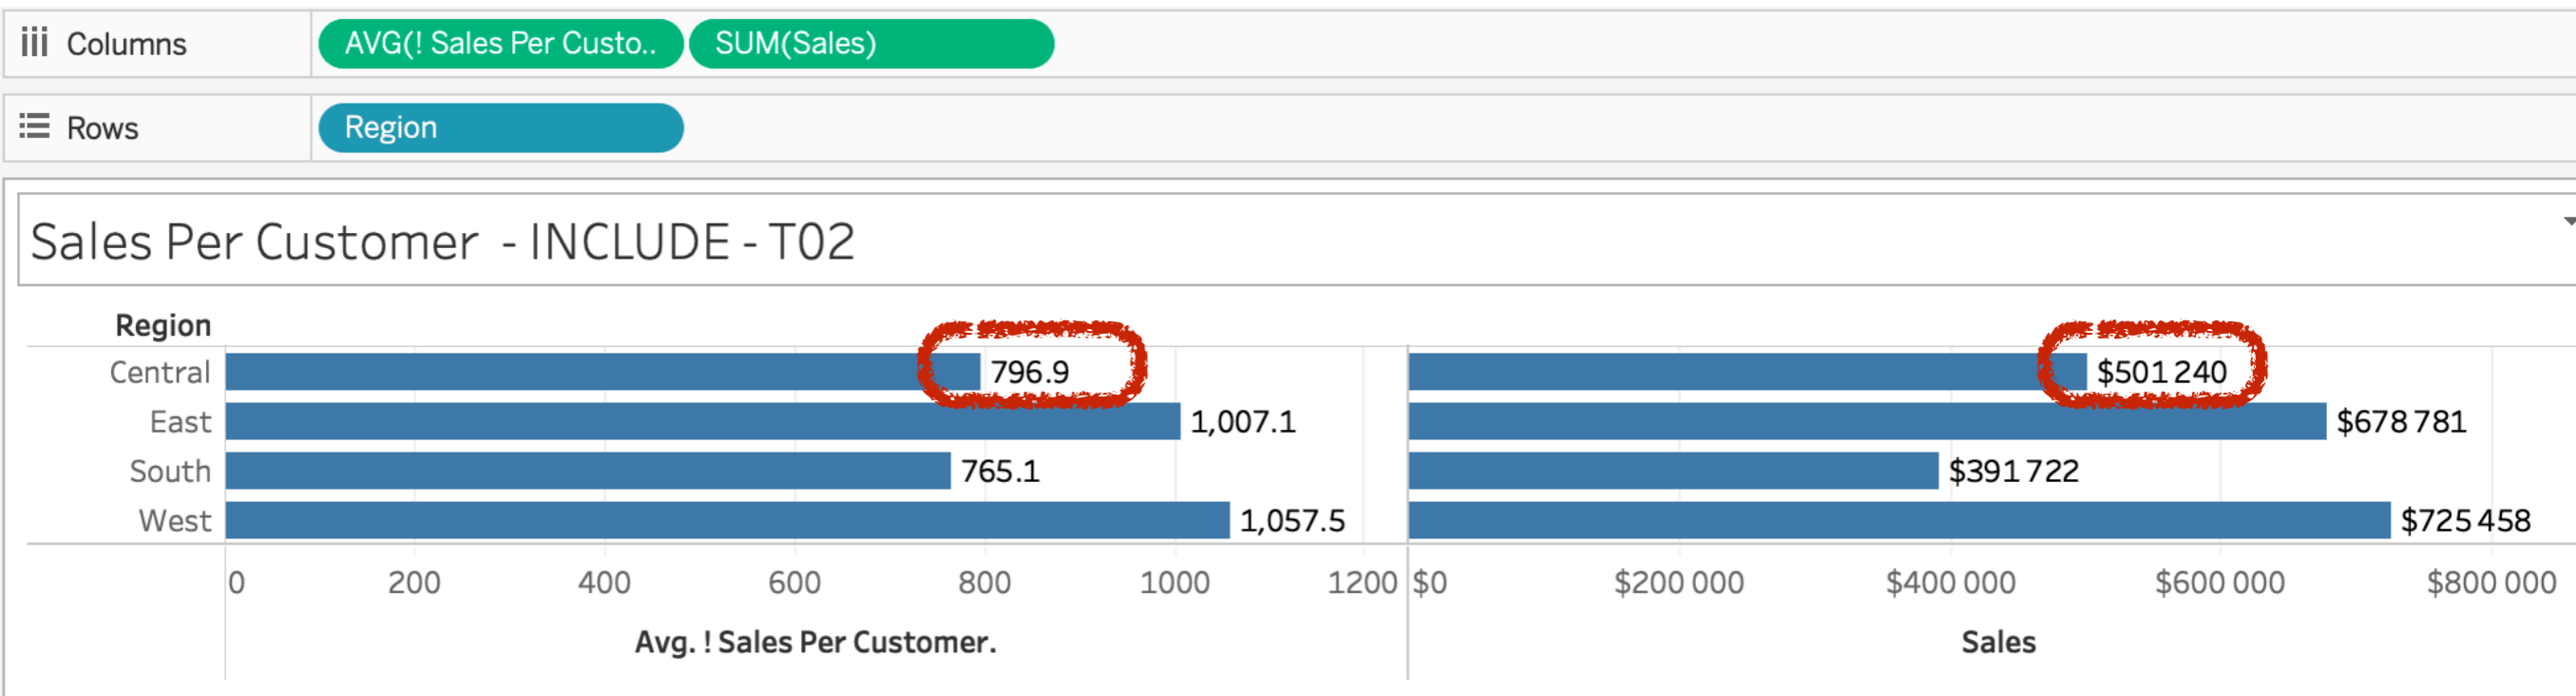

Level of Detail (LOD) expressions: INCLUDED

- Create **Sales Per Customer**.

```
{ INCLUDE [Customer Name] : SUM([Sales]) }
```

- Include both in a view with region, but aggregate the Sales Per Customer using AVG

WHY ?

Level of Detail (LOD) expressions: INCLUDED

**Improve your
Data Vis**

Sales Per Customer - INCLUDE - T03

Improve your Data Vis

The trends of Sales and Avg. Sales Per Customer. for Region. Color shows details about Sales and Avg. Sales Per Customer.. For pane Average of Sales Per Customer.: The marks are labeled by Avg. Sales Per Customer..

Level of Detail (LOD) expressions: **FIXED**

- Create ***Sales Per Region***

```
{FIXED [Region] : SUM([Sales])}
```

- Include both in a view with region and Sales Per Region in the view

- Add State to view and interpret

Region	State	Sales
Central	Illinois	501,240
	Indiana	501,240
	Iowa	501,240
	Kansas	501,240
	Michigan	501,240
	Minnesota	501,240
	Missouri	501,240
	Nebraska	501,240
	North Dakota	501,240
	Oklahoma	501,240
East	South Dakota	501,240
	Texas	501,240
	Wisconsin	501,240
	Connecticut	678,781
	Delaware	678,781
	District of Columbia	678,781
	Maine	678,781
	Maryland	678,781
	Massachusetts	678,781
	New Hampshire	678,781
New Jersey	678,781	

Level of Detail (LOD) expressions: **FIXED**

- Create ***Sales Per Region***

```
{FIXED [Region] : SUM([Sales])}
```

- Change the definition to use INCLUDE instead of FIXED
- Add State to view and interpret

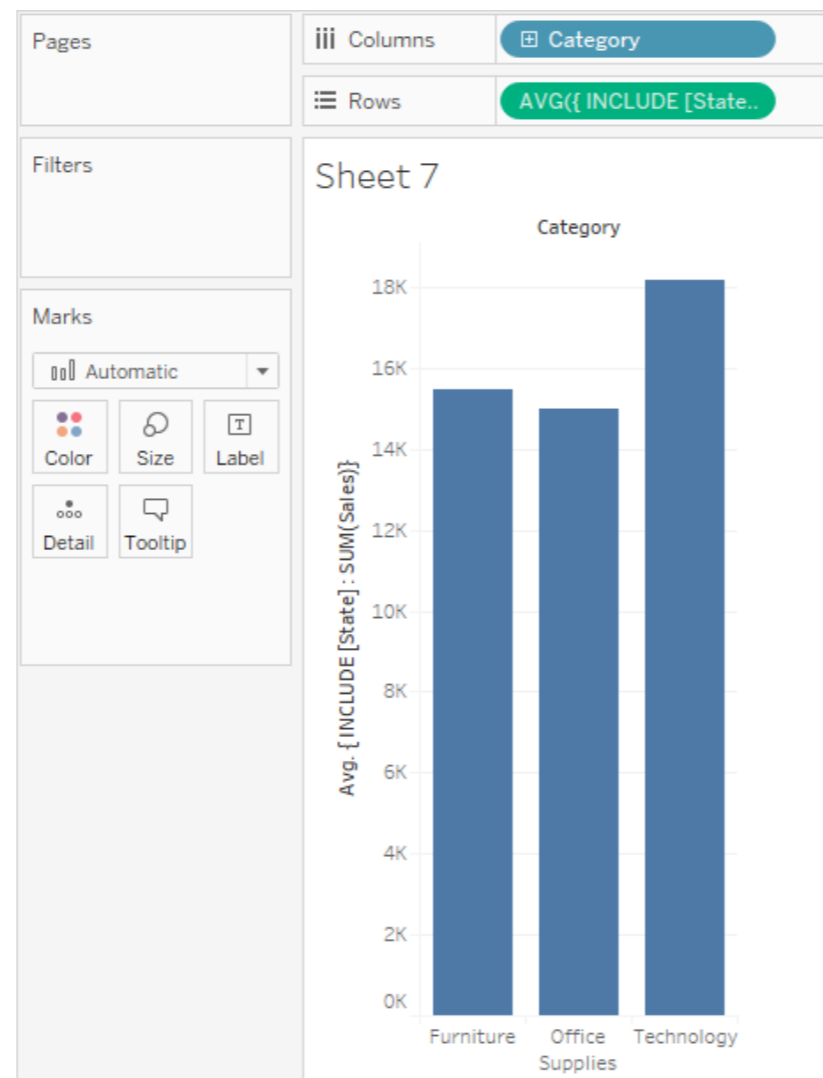

Region	State	Sales
Central	Illinois	80,166
	Indiana	53,555
	Iowa	4,580
	Kansas	2,914
	Michigan	76,270
	Minnesota	29,863
	Missouri	22,205
	Nebraska	7,465
	North Dakota	920
	Oklahoma	19,683

Level of Detail (LOD) expressions: **INCLUDE**

- Create ***Sales Per State***

```
{ INCLUDE [State] : SUM(Sales)}
```

- The calculation is placed on the Rows shelf and is **aggregated as an average**. The resulting visualization **averages the sum of sales by state across categories**.

Average of Sales by State Across Category

Level of Detail (LOD) expressions: **EXCLUDE**

- EXCLUDE level of detail expressions **declare dimensions to omit from the view level of detail.**

Level of Detail (LOD) expressions: **EXCLUDE**

- EXCLUDE level of detail expressions **declare dimensions to omit from the view level of detail.**
- EXCLUDE level of detail expressions are useful for ‘percent of total’ or ‘difference from overall average’ scenarios. ***They are comparable to such features as Totals and Reference Lines.***

Level of Detail (LOD) expressions: **EXCLUDE**

- EXCLUDE level of detail expressions **declare dimensions to omit from the view level of detail.**
- EXCLUDE level of detail expressions are useful for ‘percent of total’ or ‘difference from overall average’ scenarios. *They are comparable to such features as Totals and Reference Lines.*
- EXCLUDE level of detail expression **cannot be used in row-level expressions** (where there are no dimensions to omit), but can be used to modify either a view level calculation or anything in between (that is, you can use an EXCLUDE calculation to remove dimension from some other level of detail expression).

Level of Detail (LOD) expressions: **EXCLUDE**

```
{EXCLUDE DATETRUNC('month', [Order Date]) : AVG({FIXED DATETRUNC('month', [Order Date]) : SUM([Sales])})}
```

average sales total per month

Rows $SUM([Sales]) - SUM([average\ of\ sales\ by\ month])$

Level of Detail (LOD) expressions: **EXCLUDE**

- The following EXCLUDE level of detail expression computes the **average sales total per month** and then excludes the month component:

```
{EXCLUDE DATETRUNC('month', [Order Date]) : AVG({FIXED DATETRUNC('month', [Order Date]) : SUM([Sales])})}
```

average sales total per month

Level of Detail (LOD) expressions: **TABLE SCOPED**

It is possible to define a level of detail expression at the table level without using any of the scoping keywords. For example, the following expression returns the minimum (earliest) order date for the entire table:

```
{MIN([Order Date])}
```

This is equivalent to a FIXED level of detail expression with no dimension declaration:

```
{FIXED : MIN([Order Date])}
```

Notes on dimensions declarations in LoD expressions

- For level of detail expressions, you **can use any expression that evaluates as dimension in a dimensionality declaration**, including Date expressions.

Note: It is strongly recommended that you drag fields into the calculation editor when creating dimension declarations, instead of typing them. For example, if you see **YEAR([Order Date])** on a shelf and then type that as the dimension declaration, it will not match the field on the shelf. But if you drag the field from the shelf into the expression, it will become **DATEPART('year', [Order Date])**, and that will match the field on the shelf.

Notes on dimensions declarations in LoD expressions

With named calculations (that is, calculations that you save to the Data pane, as opposed to ad-hoc calculations, which you do not name), Tableau cannot match the name of a calculation to its definition. So if you create a named calculation, MyCalculation, defined as follows:

```
MyCalculation = YEAR([Order Date])
```

And then you created the following EXCLUDE level of detail expression and used it in the view:

```
{EXCLUDE YEAR([Order Date]) : SUM(Sales)}
```

Then MyCalculation would not be excluded.

Similarly, if the EXCLUDE expression specified MyCalculation:

```
{EXCLUDE MyCalculation : SUM(Sales)}
```

Then YEAR([Order Date]) would not be excluded.

What next?

Table Calculations

Table Calculation Types

- **Difference** From, **Percent Difference** From, **Percent** From
 - ◆ **Difference** - Current - Reference.
 - ◆ **Percent Difference** - (Current - Reference) / Current in percentage
 - ◆ **Percent** - Current / Reference in percentage
- Two values to consider: the **current value**, and the **value from which the difference should be calculated**
 - Previous, Next, First, Last
- The reference values depend on the computation order over the table (down, across, etc.)

Table Calculation Types

- **Percent of Total, Percentile, Rank**

- ◆ **Percent of Total** - computes a value as a percentage of all values in the current partition.

- ◆ **Percentile** - computes a percentile rank for each value in a partition

- ◆ **Rank** - computes a ranking for each value in a partition

- In the case of **Percentile** and **Rank** an order (ascending or descending) has to be defined

- In the case of **Rank** a *Rank Type* has to be defined: Competition (1, 2, 2, 4);

Modified Competition (1, 3, 3, 4); Dense (1, 2, 2, 3); Unique (1, 2, 3, 4)

Table Calculation Types

■ Moving Calculation

- ◆ **Moving Calculation** - determines the value for a mark in the view by performing an aggregation (sum, average, minimum, or maximum) across a specified number of values before and/or after the current value

■ Aggregation: sum, average, minimum, or maximum

■ Values before and after.

- Previous Values
- Next Values

■ Add Secondary Calculation

Table Calculation Types

■ Running Total calculation

- ◆ **Running Total** -aggregates values cumulatively in a partition. It can do this by summing values, averaging values, or replacing all values with either the lowest or highest actual value.

■ Aggregation: sum, average, minimum, or maximum

■ Add Secondary Calculation

The screenshot shows the 'Table Calculation' dialog box for 'Difference in Running Sum of Sales'. It is divided into two columns: 'Primary Calculation Type' and 'Secondary Calculation Type'.
- **Primary Calculation Type:** 'Running Total' is selected, with 'Sum' as the aggregation function.
- **Secondary Calculation Type:** 'Difference From' is selected.
- **Compute Using:** A list of calculation methods is shown, with 'Table (across)' selected.
- **Specific Dimensions:** A list of dimensions is shown with checkboxes for 'Month of Order Date' and 'Quarter of Order Date' checked, and 'Year of Order Date' unchecked.
- **Restarting every:** Set to 'None'.
- **Sort order:** Set to 'Specific Dimensions'.
- **At the level:** A dropdown menu is present.
- **Relative to:** Set to 'Previous'.
- **Checkboxes:** 'Add secondary calculation' and 'Show calculation assistance' are both checked.
